Commissioner of Patents and Trademarks

Office Action Summary

Application No.
09/004,606

Applicant(s)
Stice et al.

Examiner
Deborah Crouch

Group Art Unit
1632

☒ Responsive to communication(s) filed on May 24, 1999

☐ This action is **FINAL**.

☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11; 453 O.G. 213.

A shortened statutory period for response to this action is set to expire three (3) month(s), or thirty days, whichever is longer, from the mailing date of this communication. Failure to respond within the period for response will cause the application to become abandoned. (35 U.S.C. § 133). Extensions of time may be obtained under the provisions of 37 CFR 1.136(a).

Disposition of Claims

☒ Claim(s) 1-85 is/are pending in the application.

Of the above, claim(s) 40-49, 72-76, and 83 is/are withdrawn from consideration.

☐ Claim(s) _____ is/are allowed.

☒ Claim(s) 1-39, 50-71, 77-82, 84, and 85 is/are rejected.

☐ Claim(s) _____ is/are objected to.

☐ Claims _____ are subject to restriction or election requirement.

Application Papers

☐ See the attached Notice of Draftsperson's Patent Drawing Review, PTO-948.

☐ The drawing(s) filed on _____ is/are objected to by the Examiner.

☐ The proposed drawing correction, filed on _____ is ☐ approved ☐ disapproved.

☐ The specification is objected to by the Examiner.

☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. § 119

☐ Acknowledgement is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d).

☐ All ☐ Some* ☐ None of the CERTIFIED copies of the priority documents have been
☐ received.

☐ received in Application No. (Series Code/Serial Number) _____.

☐ received in this national stage application from the International Bureau (PCT Rule 17.2(a)).

*Certified copies not received: _____.

☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. § 119(e).

Attachment(s)

☐ Notice of Informal Patent Application, PTO-152

--- SEE OFFICE ACTION ON THE FOLLOWING PAGES ---

Applicant's election without traverse of group I in Paper No. 10 is acknowledged.

Claims 1-85 are pending. Claims 1-39,50-71, 77-82,84 and 85 are examined in this office action.

Applicant has claimed "cows" which is taken to be only the female bovine.

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970);and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer.. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-19,26,27,31-34,36,38,50-52,54,56,58,59,61,63,65-69,84 and 85 are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 103-126 of allowed of U.S. Patent No. 08/781,752 Although the conflicting claims are not identical, they are not patentably distinct from each other because the instant claims are obvious over the claims of '752. The instant claims are methods of cloning a cow and methods of cloning transgenic cows. The claims of '752 are to methods of cloning mammals and methods of cloning transgenic mammals, with a specific claim to bovine. Thus the instant claims are obvious over the claims of '752 as the ordinary artisan having claims 103-126 would have sufficient teachings and motivation to produce the cloned cows as instantly claimed.

These are provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claims 1-19,26,27,31-34,36,38,50-52,54,56,58,59,61,63,65-69,84 and 85 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

The claims are drawn to a method of cloning a cow comprising inserting a differentiated cow cell or cell nucleus, a differentiated cow cell or cell nucleus wherein a DNA sequence is inserted, removed or modified, a cow CICM cell or cell nucleus, into an enucleated mammalian oocyte, activating the nuclear transfer unit, culturing the activated nuclear transfer unit to greater than the 2-cell stage and transferring the cultured nuclear transfer unit to a host mammal, a method of producing a CICM cell line comprising inserting a differentiated cow cell or cell nucleus, or a differentiated cow cell or cell nucleus wherein a DNA sequence is inserted, removed or modified, into an enucleated mammalian oocyte, activating the nuclear transfer unit, culturing the activated nuclear transfer unit to greater than the 2-cell stage and culturing cells obtained from the nuclear transfer unit, a method of producing a pharmaceutically active protein expressing a transgenic cow offspring, and methods of making chimeric cows.

The claims are not enabled as the specification does not provide sufficient guidance on cloning cows, cloning transgenic cows, methods of making a pharmaceutically active protein or methods of making chimeric cows by the methods claimed such the artisan could repeat the method and have a reasonable expectation of success. The nature of the art at the time of filing was that the cloning of a cow, that is the production of a fully, developed cow from a fully differentiated cow cell or from a nucleus of a fully differentiated cow cell was unlikely to be successful. At the time of filing, the art knew that the transfer of nuclei from differentiated adult cells into frog oocyte would result in the production of tadpoles, but not the differentiation to adult frogs (Wilmut et al, page 810, col. 2, parag. 2, lines 1-3). The art, however, had reported the development of mammals by the insertion of a nucleus from a totipotent embryonic cells into

an enucleated oocyte (US Patent 4,994,384, col. 10, lines 4-10; Sims et al, page 6146, col. 2, parag. 1-3 and Campbell et al, page 65, col. 2, lines 3-11). Thus the artisan while being able at the time of filing to obtain guidance from the art on the production of mammals by the insertion of a nucleus from a totipotent embryonic cell into an enucleated oocyte, the artisan could not have found such guidance when the nucleus was from a fully differentiated cell. For this the artisan could only rely on the instant specification.

The specification provides working examples to show the development of chimeric an transgenic bovine embryos and fetuses, but no production of a live birth. Example 1 demonstrates the production of fibroblast cultures from fetal bovine and porcine tissues and from adult bovine tissue. Cells from each of these cultures were shown to take up and express the β -galactosidase gene. One cell line, CL-1, a fetal bovine fibroblast cell line, provided the donor nucleus for nuclear transfer experiments where transgenic fetal bovines. Example 2 demonstrates the production of CICM cells first producing a nuclear transfer unit by inserting the nucleus of a bovine fetal fibroblast (CL-1) into an enucleated oocyte and culturing the nuclear transfer unit. Disaggregation of the cultured NT's resulted in CICM cultures. Intact CICM cells were inserted into 8-16 cell embryos to produce chimeric fetal calves. Transgenic fetal calves were produced by removing the nucleus of a CICM cell and inserting it into an enucleated oocyte, as was done in example 1 with fetal fibroblasts. However none of these examples demonstrate the live birth of a cow, a transgenic cow, or a chimeric cow. There is no evidence to support the production of cow embryos with isolation and culture of the inner cell mass cells. In addition, there is no showing that expression of the transgene would be sufficient to produce a pharmaceutically active protein. This remains unpredictable, as even the more established methods where totipotent embryonic cell nuclei were used resulted in the loss of sheep during gestation (Campbell et al, page 65, col. 2, lines 5-10). Even post-filing art, employing a method similar to applicant's resulted in the birth of only one sheep, further demonstrating the

unpredictability of the claimed method (Wilmot et al, page 812). in particular these examples do not provide guidance for serum starvation of the cells. There is no guidance as to the length of time of serum starvation the cow differentiated cells would need in order to be reprogrammed and be functional as totipotent cells.

The production of chimeric animals is of itself lacking reproducibility. There are not guidelines provided in the specification for the production of a chimeric cows such that the cow has a use to the art. Chimeric cows are unpredictable, as the contribution of the transferred cell or nucleus is not controllable. There is no method for regulating those portions of the cow to which the transferred cell or nucleus contributes, nor is there a method for reproducibly making chimeric cows that are the same. For example is cow 1, the transferred cell or nucleus may contribute to the liver, and in cow 2, it may contribute to the brain. There is no way to reproducibly ensure that the transferred cell or nucleus contributes the same in multiple cows. Thus the production of chimeric cows is unpredictable.

Further, there is no evidence of record that the transgenic or chimeric fetuses and cows produced by the instantly disclosed method would result in cow that would provide organs for transplantation. The transgene would need to be expressed sufficiently so that the organ would be immune from rejection for example. The showing of β -galactosidase expression is not sufficient to demonstrate transgene expression sufficient for transplantation. There is no correlation in the art or in the specification between levels of β -galactosidase expression and levels of transgene expression in general that affords a new use to cowian embryos, fetuses, offspring or progeny. The specification at page 15, parag. 4 and page 16, parag. 3 discusses the uses of the cows as organ donors. It is not clear how a cow that does not express a transgene that alters the host-graft response will be useful as an organ donor. As for other uses, the specification fails to disclose other clear uses for the cows and none are apparent. There is no

evidence that the cows made by the disclosed methods provide a patentable use. The question here is how would the artisan use the cows made by the method?

The unpredictability of the method as a whole lies in the need to convert a differentiated cell to a totipotent cells. As cells contain the same DNA complement. However, in differentiated tissues, not all DNA sequences are expressed. For example, a liver does not make rhodopsin and retinal cell structures, and retinal cells do not make clotting factors and hepatocyte structures. For a cell to go through all the steps of development it, or its nucleus, must be reverted back to the stage where all DNA sequences can potentially be expressed, and expression regulated according to developmental stage. Applicant has not shown that the method of cloning using transferred cell or nucleus demonstrated is sufficient for the production of fully developed cows. The examples show the production of transgenic and chimeric bovine fetuses, but there is no demonstration that the activation method would active non-bovine nuclei. Further, the gene activation time for cow embryos may be critical for producing a fully differentiated cow. Activation times were known in the art to vary: the mouse activates at the 2-cell stage, and human, cow and sheep activate around the 4 to 8 cell stage (Schultz et al, page 206, col. 2, parag. 2, lines 1-3). The activation time may be critical for the production of a fully developed cow.

Further, applicant is not enabled for transferring the NT unit to a host mammal. The placenta for all mammals is made from embryonic tissue. The implantation of a cow NT unit into a sheep for example, would result in an immune response being initiated by the host ewe that would result in a loss of the cow embryo or fetus. For this reason, applicant, once overcoming the rejections above, would only be limited to transfer of the cow NT unit into a host cow.

As the production of an CICM cell line would require, by applicant's claim, first the production of a cow embryo by the claimed methods, the method of producing a cow embryo would need to be enabled. Once enablement of the embryo is enabled, the method of producing

a CICM cell line would be enabled as the inner cell mass comes from the embryos and can be produced by methods already known in the art from producing CICM cell lines from embryos produced by other methods.

Applicant is not enabled for methods of producing a pharmaceutically active protein which is isolated from a transgenic cow offspring, or the isolation of such a protein from milk of the cow. There is no evidence of record that a cow produced by the method of cloning would express a protein sufficiently in any of its tissues or organs sufficiently to produce a proteins of any type. The phrase "pharmaceutically active" further implies that the protein would be effective in treating a disease or condition. There is no evidence that the transgene expression obtained would be sufficient either for isolation or pharmaceutical purposes. The art at the time of filing taught that transgenic express was unpredictable without an undue amount of experimentation. At the time of filing, the choices of promoter/enhancer and other regulatory sequences, as well as the insertion site of the transgene into the genome of the animal was considered unpredictable. Transgenic animals were regarded to have within their cells cellular mechanisms which prevent expression of the transgene, such as DNA methylation or deletion from the genome (Kappell et al (1992) Current Opinion in Biotechnology 3, 549, col. 2, parag. 2). Additionally, "the position effect" and unidentified control elements also were recognized to cause aberrant expression (Wall (1996) Theriogenology 45, 61, parag. 2, line 9 to page 62, line 3). The elements of the particular construct used to make transgenic animals were held to be critical, and that they must be designed case by case without general rules to obtain good expression of a transgene; e.g., specific promoters, presence or absence of introns, etc. (Houdebine (1994) Journal of Biotechnology, constructs, page 275, col. 1, parag. 1).

As for claims 31,51,52,54,56,59 and 63 to methods of producing an CICM cell line, methods of producing an CICM cell line that has a desired DNA inserted, removed or modified, and methods of using the CICM cell line to produce a chimeric embryo or chimera by insertion of

a CICM cell into a fertilized cow embryo is not enabled. For the methods of claims 31,51,52,54,56,59 and 63, the CICM cell would need to have totipotency, such that the genetic contribution of the CICM cell line would pass through the germ line. At the time of filing, the art taught for most mammals no definitive totipotent ES cells had been produced. Mullins et al. disclosed that "although to date chimeric animals have been generated from several species including the pig, in no species other than the mouse has germline transmission of an ES cell been successfully demonstrated." (Mullins et al (1996) Journal of Clinical Investigation page S38, column 1, first paragraph). The totipotency for ES cell technology in many livestock species has not been demonstrated (Seamark (1994) Reproductive Fertility and Development, page 6, Abstract). The specification does not provide guidance to overcome these art teachings that methodology for cow ES cell production was not known at the time of filing. While applicant may have a new method of producing an inner cell mass culture, applicant has not provided any evidence that these cells contribute to the germline in any fashion. If the germline does not contain any contribution from the inner cells mass genome, it is not seen how these methods have an enabled use. These methods are outside the claims to methods of cloning a cow, but enter into the realm of embryo reconstitution with an embryonic cell. Furthermore, it is not seen as how the methods of making chimeras has a use in the art. Chimeras on their face are unpredictable as there is no methodology which assures the reproducibility of making any particular chimera with any particular phenotype. Chimerism is a happenstance whereby the pattern of contribution by the recipient embryo and donor CICM cell genomes can not be controlled or predictably reproduced. Reproducibility is a requirement for enablement. In this regard claims 31,51,52,54,56,59 and 63 to methods of producing an inner mass cell line which includes methods of producing chimeric embryos, fetuses, progeny and offspring are not seen as having an enabled use also because the production of a chimeric embryo, fetus, progeny and offspring is not seen as reproducible for any particular phenotype.

Claim 31,52,54,56,58,59,61 and 63 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

Claims 31,52,54,56,58,59,61 and 63 are confusing because claims 31 and 58 are written as a method of producing an CICM cell line. Claims 52,54,56,58,59,61 and 63 read as if they are methods of producing chimeric embryos, fetuses, progeny and offspring. In particular, chimeric fetuses, progeny and offspring do not have the embryonic structure of an inner cell mass. Applicant should re-write claims 52,54,56,58,59,61 and 63 as method of producing chimeric embryos, fetuses, progeny and offspring.

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 20-22,60,70,71,77 and 81 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by US Patent 5,057,420 issued October 15, 1991 ('420).

The claims are drawn to fetuses, offspring and progeny produced by claimed methods of cloning a cow. However, as claims 20-22,60,70,71,77 and 81 are product by process claims, a teaching of the same products obtained by a different method serves as anticipatory art against the instantly rejected claims.

'420 teaches bovine embryo, fetuses and offspring (col. 5-6, table 1). Claims 20-22,60,70,71,77 and 81 do not distinguish the embryos, fetuses, offspring and progeny claimed from the embryos, fetuses and offspring taught by '420. Without a distinction which indicates a

structural or functional difference between the claimed embryos, fetuses, offspring and progeny and those disclosed in '420, '420 clearly anticipates the claimed invention.

Claims 23-25,28-30,53,55,57,62,64,78,79,80 and 82 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by Hyttinen et al (1994) Bio/Technology 12, 606-608.

The claims are drawn to transgenic, chimeric and transgenic/chimeric fetuses, offspring and progeny produced by claimed methods of cloning a cow. However, as claims 23-25,28-30,53,55,57,62,64,78,79,80 and 82 are product by process claims, a teaching of the same products obtained by a different method serves as anticipatory art against the instantly rejected claims.

Hyttinen et al teach the production of transgenic and chimeric or mosaic bovine embryos, fetuses and calves (page 606, col. 2, parag. 2 to page 607, col. 2, lines 4). Claims 23-25,28-30,53,55,57,62,64,78, 79,80 and 82 do not distinguish from the embryos, fetuses, offspring and progeny claimed from the embryos, fetuses and offspring taught by Hyttinen et al. Without a distinction which indicates a structural or functional difference between the claimed embryos, fetuses, offspring and progeny and those disclosed in Hyttinen, Hyttinen clearly anticipates the claimed invention.

Claim 35 is rejected under 35 U.S.C. 102(b) as being clearly anticipated by Sims et al (1993) Proceed, Natl. Acad. Sci. 90, 6143-6147.

Claim 35 is drawn to a bovine CICM cell line. However, as claim 35 is a product by process claim, a teaching of the same product obtained by a different method serves as anticipatory art against the claim.

Sims et al teach the culture of bovine ICM cells as cell lines 6-10 (page 6146, col. 1, parag. 2 and table 4). Claims 29 does not distinguish from the ICM cell line taught by Sims et al. Without a distinction which indicates a structural or functional difference between the claimed cell line and that disclosed in Sims et al, Sims et al clearly anticipates the claimed invention.

Claim 39 is rejected under 35 U.S.C. 102(b) as being clearly anticipated by Donkin et al (1993) J. Animal Sci. 71, 2218-2227.

Claim 39 is drawn to bovine differentiated cells made by a claimed process. However, as a product by process claim, a teaching of the same product by a different method serves as anticipatory art.

Donkin teaches differentiated bovine hepatocyte from male dairy calves (page 2220, col. 1, parag. 1). Claim 39 does not distinguish from the hepatocytes taught by Donkin et al. Without a distinction which indicates a structural or functional difference between the claimed differentiated cells and those taught by Donkin et al, Donkin et al clearly anticipates the claimed invention.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claim 37 is rejected under 35 U.S.C. 103(a) as being unpatentable over Sims et al (1993) Proc. Natl. Acad. Sci. 90, 6143-6147 in view of Lovell-Badge et al, Cold Spring Harbor Symp. Quant. Biol., Vol. 50, pages 707-711, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, New York, 1985.

Claim 37 is drawn to a transgenic CICM cell line.

Sims et al teach the culture of bovine ICM cells as cell lines 6-10 (page 6146, col. 1, parag. 2 and table 4). However, Sims does not teach a transgenic bovine CICM cell line. Lovell-Badge teaches mouse embryonic stem cells which have been transformed with a DNA sequence encoding human type II collagen gene (page 708, col. 2, parag. 3, lines 1-4). Motivation is provided by Sims et al stating that embryonic stem cells are derived from ICM cells, and that transgenic embryonic stem cells would be advantageous for the production of cattle (page 6146,

Serial Number: 09/004,606
Art Unit: 1632

Page 12

col. 2, parag. 6, line 4 to page 6147, line 2). Thus, it would have been obvious to the ordinary artisan at the time of the instant invention to produce a transgenic CICM cell line for use in the production of transgenic non-human cows.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Deborah Crouch, Ph.D. whose telephone number is (703) 308-1126.
